ABSTRACT OF THE DISCLOSURE

METHOD FOR THE ROUTING OF IP FRAMES BETWEEN THE USERS OF A VARIABLE GRAPH NETWORK

Disclosed is a virtual router distributed on a carrier network fulfilling a distributed virtual routing function, said carrier network comprising one or more components, each of the components comprising at least two nodes communicating with one another by means of an artery, a node comprising a [[FAx]] an access function and server functions (LES/BUS, LECS, MPS). At least one component of said network comprises the following elements:

- several ELANi-bridges <u>bridge ELANs</u>, each <u>ELANi bridge bridge ELAN</u> being connected to a virtual network <u>VLANi-VLAN</u>,
- at least one transit ELAN, Tx, all access functions of the same component being adjacent through said transit ELAN, and
- at the level of an access function [[Fax]]:
 - router LEC means [[Rix]] adapted to connecting connect the access function [[Fax]] to at least one <u>BLANi</u> <u>bridge ELAN</u> associated with a VLANi VLAN,
 - means [[(Lx)]] for the identification of the VLANi <u>VLANs</u> serviced by the access function [[FAx]],
 - means (transit LEC transit) to connect the transit ELAN transit to the access function.

Use of a distributed virtual router ATM-type carrier networks and IP data packets.
